

Group Decision OS - Product Requirements Document (PRD)

1. Problem Statement

Group decisions are currently made in unstructured environments like WhatsApp, meetings, or calls. This leads to confusion, slow decision-making, lack of accountability, and no historical record of decisions.

2. Product Vision

A universal decision-making platform that enables any group to structure choices, vote efficiently, and reach clear, trackable outcomes.

3. Goals

- Reduce time required for group decisions
- Provide structured comparison of options
- Enable transparent and accountable voting
- Store decision history for analysis
- Support both casual and business use cases

4. Non-Goals (Important)

- Not a social media platform
- Not a full e-commerce or booking system
- Not replacing domain-specific platforms (Uber, Airbnb, etc.)
- Not a messaging/chat app

5. Target Users

- Friends / families making daily decisions
- Roommates deciding shared living matters
- Small teams making operational decisions
- Car dealerships and buyers (initial niche)
- Travel groups planning trips

6. Core Features (MVP)

- Create a decision (title + description)
- Add multiple options with details (image, price, notes)
- Invite participants via link
- Voting system (yes/no, rank, weighted votes)
- Real-time results display
- Final decision lock and summary

7. Advanced Features (Post-MVP)

- AI-generated recommendations
- Decision confidence scoring
- Anonymous voting mode
- Role-based voting (owner, advisor, member)
- Decision history analytics

8. Data Model (Simplified)

- User: id, name, email
- Decision: id, title, description, createdBy, status
- Option: id, decisionId, title, metadata
- Vote: id, decisionId, userId, optionId, weight
- Result: decisionId, winningOptionId

9. Monetization Strategy

- Freemium model (basic decisions free)
- Subscription (\$5–10/month for advanced features)
- B2B team plans
- Future: AI insights and analytics add-on
- Future: API access for businesses

10. User Flow

Create Decision → Add Options → Invite Participants → Voting Phase → Result → History Saved

11. Suggested Tech Stack

- Frontend: React Native (iOS + Android)
- Backend: Node.js (NestJS or Express)
- Database: PostgreSQL
- Real-time: WebSockets or Firebase
- Hosting: AWS / GCP

12. MVP Scope (First 2–4 Weeks)

- Basic decision creation
- Option management
- Voting system
- Simple result calculation
- Shareable invite link

13. Roadmap

- Phase 1: MVP build (2–4 weeks)
- Phase 2: User testing + iteration
- Phase 3: Add AI features
- Phase 4: Expand to team/business use cases
